

Hello everyone.

Thanks for the opportunity. My name is Marco, I'm writing this notes in english to practice my english. Also, beacuse the instructions were in english and it was interesting to do the same.

The technology I used for this test were:

## **REDUX**

An open-source Javascript for managing and updating applicationn state, using events called actions.

## **REACT**

A Javascript library develeped by Facebook, used for building interfaces or UI components. Can be used as a base in the development of single-page or mobile applications.

## MATERIAL-UI

A React UI framework that use components for faster and easier web development.

For this project I used the command “yarn” to create the react app. When you clone the repository, before start using it, you will need to execute “yarn install” to install all the dependencies that the project needs.

And then, to run the app, just execute yarn start in command line.

The instructions said that the test take about 2 weeks, so I did my best for this test in three days.

I'll be waiting for your response.

Thanks and have a great week.

Marco, developer front end.
